

# MPTCP - Scheduling

A brief overview of algorithms, their strengths and areas of application.

Henrik Gerdes

hegerdes@uos.de

September 23, 2021

# Table of Contents I

- 1** MPTCP introduction
  - State of MPTCP
- 2** MPTCP challenges
  - Asymmetric paths
  - Blocking
- 3** MPTCP scheduler
  - LRF
  - BLEST
  - STTF
  - ECF
- 4** MPTCP evaluation
  - Functional
  - Benchmarks

# Outline

## 1 MPTCP introduction

- State of MPTCP

## 2 MPTCP challenges

- Asymmetric paths
- Blocking

## 3 MPTCP scheduler

- LRF
- BLEST
- STTF
- ECF

## 4 MPTCP evaluation

- Functional
- Benchmarks

# MPTCP IS HERE!

## Korean & Hrvatski Telecom enabled MPTCP

- Android smartphones can bond WiFi and LTE
- Allows download speeds of 800 Mbps

## French ISP OVH 2015

- OverTheBox service is MPTCP capable
- Bond several DSL cable links

## Other

- Apples SIRI
- Several MPTCP Linux implementations
- Deployable for everyone with SOCKS

# A First Analysis of Multipath TCP on Smartphones

- Catholic University of Louvain
- Real word usage with a dozen of users
- Linux MPTCP v0.89.5 and Android 4.4
- Android with ShadowSocks
- SOCKS proxy with tcpdump
- Belgium from March 8th to April 28th 2015
- Total traffic of 25.4 GB in test period
- Over 390,782 MPTCP connections

## Data analysis

Number of subflows	1	2	3	4	5	>5
Percentage of connections	67.75%	29.96%	1.07%	0.48%	0.26%	0.48%

**Table:** Number of subflows per MPTCP connection, Source:[DCBHB16]

Port	# connections	% connections	Bytes	% bytes
53	107,012	27.4	17.4 MB	<0.1
80	103,597	26.5	14,943 MB	58.8
443	104,223	26.7	9,253 MB	36.4
4070	571	0.1	91.7 MB	0.4
5228	10,602	2.7	27.3	0.1
8009	10,765	2.8	0.97	<0.1
Others	54,012	13.8	1.090 MB	4.4

**Table:** Statistics about destination port, Source: [DCBHB16]

# MPTCP promises to:

Offer resilience

Increases bandwidth

Provide seamless handovers

Backwards compatible and deployable

...

# Outline

## 1 MPTCP introduction

- State of MPTCP

## 2 MPTCP challenges

- Asymmetric paths
- Blocking

## 3 MPTCP scheduler

- LRF
- BLEST
- STTF
- ECF

## 4 MPTCP evaluation

- Functional
- Benchmarks

## Asymmetric paths

Multiple subflows have different characteristics  
in terms of:

- Round Trip Time (Latency)
- Bandwidth (Throughput)
- Error rate (Reliability)

# Blocking

**Figure:** Head-of-line blocking and receive buffer blocking, Source: [YFD<sup>+</sup>16]

# Outline

- 1 MPTCP introduction
  - State of MPTCP
- 2 MPTCP challenges
  - Asymmetric paths
  - Blocking
- 3 **MPTCP scheduler**
  - LRF
  - BLEST
  - STTF
  - ECF
- 4 MPTCP evaluation
  - Functional
  - Benchmarks

# MPTCP scheduler

- 1 Lowest-RTT-First (LRF)
- 2 BLock ESTimation (BLEST)
- 3 Shortest Transfer Time First (STTF)
- 4 Earliest Completion First (ECF)
- 5 Additional schedulers

## Lowest-RTT-First

- 1 Uses the subflow with the lowest RTT
- 2 Until congestion window is filled
- 3 Use next lowest RTT
- 4 Standard Linux scheduler

---

$$\begin{aligned}err &= measured_{RTT} - predic \\ predic_{new} &= predic_{old} + \frac{1}{8} * err \\ variation_{new} &= \frac{3}{4} * variation_{old} + \frac{1}{4} * ||err|| \\ RTO &= predic + 4 * variation\end{aligned}$$

Table: Jacobson's Algorithm

## BLOCK ESTimation scheduler

- Specifically designed for asymmetric paths
- Estimate the amount of blocking
- Additional send window on the connection level
- Added to Linux MPTCP in June 2019

Skips subflow if:

$$X \times \lambda > |MPTCP_{SW}| - MSS_S * (inflight_S + 1) \quad (1)$$

$$X = MSS_F * \left( CWND + \left( \frac{RTT_S}{RTT_F} - 1 \right) / 2 \right) \times \frac{RTT_S}{RTT_F} \quad (2)$$

## Shortest Transfer Time First

- Similar approach as LRF
- Considers enqueued packets
- Quick response to network changes
- Fast rescheduling
- Latency orientated scheduler
- Resource heavy and complex implementation

# Earliest Completion First

- Similar approach as LRF and STTF
- Is able to skip subflows for small amounts of data transmissions
- Prioritizes throughput over latency
- Can also combine subflows for big transmissions

Skips subflow if:

$$RTT_F + \frac{k}{CWND_F} \times RTT_F \leq RTT_S \quad (3)$$

## Inner workings

**Figure:** Scheduling decisions for a burst of 15 segments, using the LRF, BLEST, and STTF schedulers, Source: [YFD<sup>+</sup>16]

## Additional schedulers

- Out-of-Order Transmission for In-Order Arrival Scheduler (OTIAS)
- Delay-Aware Packet Scheduler (DAPS)
- RoundRobin (RR)
- Redundant Scheduler

# Outline

- 1** MPTCP introduction
  - State of MPTCP
- 2** MPTCP challenges
  - Asymmetric paths
  - Blocking
- 3** MPTCP scheduler
  - LRF
  - BLEST
  - STTF
  - ECF
- 4** MPTCP evaluation
  - Functional
  - Benchmarks

## Schedulers in short

- 1 LRF und RR are not suitable for asymmetric paths
- 2 LRF does not consider the relative subflows RTT difference
- 3 BLEST and STTF both prioritize latency. Both are able to skip subflows
- 4 STTF is complex and heavy
- 5 ECF improves utilization of the fastest subflow. Prioritizes throughput

## **1 Controlled latency analysis**

## **2 Controlled bandwidth analysis**

## **3 Real-World analysis**

## Performance baseline

- Results for LRF, DAPS, OTIAS, ECF
- Figure a): WLAN/3G setup
- Figure b): WLAN/WLAN setup
- All schedulers perform similarly with marginal differences in a)
- Increased page load times for DAPS and OTIAS in b)

**Figure:** Page load time for web traffic,  
Source: [HGB<sup>+</sup>18]

# Latency

**Figure:** Average transmission time for schedulers, Source: [HGB<sup>+</sup>18]

Figure: Average Download Completion Time, Source: [LNTG17]

## Throughput I

- Increasing asynchrony
- WLAN 1 MBps and LTE 1 to 10 MBps
- DAPS is always worse
- ECF fastest with BLEST
- Shows intact of growing RTT asynchrony
- Throughput degrades drastically if  $\frac{RTT_2}{RTT_1} \leq 4$
- A single TCP connection can deliver higher throughput (on highly asymmetric

Figure: Average goodput for TCP and MPTCP (LRF, BLEST, and STTF), Source: [HGB<sup>+</sup>18]

## Real-World

- $RTT_{WLAN} \approx 25ms$   
&  $RTT_{3G} \approx 75ms$
- Object load times improved by up to 26% (BLEST) and 32% (STTF)
- Practical ECF test showed 26% faster load of CNN-page
- ECF improved video streaming throughput by 16% (WLAN-Spot & LTE)

**Figure:** Page load and object times for HTTP2,  
Source: [HGB<sup>+</sup>18]

# Conclusion time

- Best scheduler is ... it depends
- Know your use cases
- Default scheduler are not optimized for asymmetric paths
- BLEST is a promising scheduler for asymmetric paths
- Linux-MPTCP is flexible and easy adoptable
- Development is active and MPTCP evolves fast new MPTCP RFC 6884 revision (March 2020)

# Questions?

Thank you for your attention!  
Any questions?

# Shortest Transfer Time First

```

1  function TRANSFER_TIME:
2      if cwnd_free > 0 and data_to_send < cwnd_free then
3          return rtt / 2
4      transfer_time = transfer_time + rtt
5      cwnd = increase_cwnd(current_cc_state)
6
7      if data_to_send <= max_segments_in_ss then
8          transfer_time = transfer_time + rtt * (rounds_in_ss-1) + rtt/2
9          return transfer_time
10     else if cwnd < ssthresh then
11         transfer_time = transfer_time + max_rounds_in_ss * rtt
12         if ends_in_ss(data_to_send) then
13             return transfer_time
14
15     cwnd = ssthresh
16     transmission_time += rtt * (rounds_in_ca - 1) + rtt / 2
17     return transfer_time
